

Part B - Question 2: The 1000 Company Proposal

Objective

Build a verified list of 1000 ICP-qualified companies within one month while maintaining quality, evidence discipline and accurate qualification.

Week 1 - Building the Universe

Collect 3500–4000 companies from DSIR databases, industry associations, BSE/NSE SME listings, MCA records, LinkedIn, industrial clusters and trade exhibition directories. Organize them by city, segment and website.

Week 2 - Research and Qualification

Use company websites, annual reports, LinkedIn profiles and public databases to evaluate each company. Companies are scored against manufacturer status, accessibility, differentiation, leadership quality, industry tailwinds and growth signals.

Week 3 - Automation and Quality Control

Use AI tools and spreadsheets to speed up analysis. Borderline companies are manually reviewed. False positives are removed and missing information is verified.

Week 4 - Final Verification

Prepare the final list of 1000 qualified companies. Add personalization hooks, verify leadership details and ensure each company has evidence supporting its inclusion.

Automation Strategy

AI tools can assist in summarizing websites, extracting leadership information and organizing data. However, final decisions should be validated through human review.

Expected Funnel

3500–4000 sourced companies → 2000–2500 screened companies → 1200–1400 potential matches → 1000 verified final companies.

Risk Management

If qualification rates are low, additional sources such as state industrial directories, export promotion councils and niche industry databases can be added.

Final Deliverables

A master company database, qualification scores, evidence references, personalization hooks and a documented methodology for future scaling.
